

I oppose the Bishop and Buttrey special exemption. I'd like to submit for the record, a report from 2015 from Save The Water, teamed up with United Global Outreach and UCF Engineers without borders; and a report from Channel 9 Investigates from 2016. These reports prove the damage previously caused to our water supply, by recycling operations in our community.

Their property has been excavated deep enough, that there's standing water, which means that they're either close to the aquifer or they've already reached it. This organization stated they will be collecting and recycling yard waste and letting it biodegrade on the property. If any of these materials are diseased or chemically treated, it'll leach into the aquifer and affect our water indefinitely. Yard waste doesn't biodegrade quickly. It'll take a long time, exposing our community to chemicals like TCE; that can cause multiple types of cancer and neurological problems. They stated they'll be producing mulch from materials they receive. Any mulch producer will tell you that they use trees specifically grown for this purpose, **NOT** from contaminated or diseased yard waste. This recycling operation will not only affect our community's water supply, it will affect surrounding communities' water supply too.

In closing, I ask the board to reject the special exemption and stand with our community. We've seen the damage these organizations do to communities like ours and if they're granted exception and allowed to expand, it will further erode our water and affect future generations.

Bithlo Water Contamination: Coming Together to Make a Difference Q/A

Posted in: [Water Contamination](#)

By [Taylor Schaefer](#), Writing Project Leader for Save The Water™ | April 6, 2015

Imagine if your backyard was a dumping ground for toxic materials, endangering your children's safety and threatening the health of you and your family members. For many in the town of Bithlo, Florida, this is a real-life nightmare. For years, Bithlo residents have had to live with a tainted water supply, causing a multitude of issues throughout the community. Due to the local government's complacent actions towards this long-running issue, residents have lost trust in the government and wish to remain independent of its rules and mandates involving public water. Recognizing the urgency of this issue, local organizations have come together in order to rejuvenate the community in more ways than one.

Over 8,000 Bithlo residents have been without clean water for decades due to the exploitation of the area. Companies used Bithlo as a dumping ground for dangerous chemicals including arsenic, mercury, chloromethane, and trihalomethane. Among the perpetrators, a previously owned property of A-Z Recycling has become the most notable symbol for pollution in Bithlo. Numerous studies and documents found that the area is unsafe because of the asbestos-laden material left behind by the recycling company. The property was a sinkhole and the extent of the pollution prior to the fill-in is unknown. Adding to this, Circle K deposited large amounts of petroleum, contaminating the groundwater and off-site wells in the late 1980s.

While people living in the surrounding area continue to acquire health issues, fines and violations for the dumping ground also remain constant. The county has let a \$250 fine rise to well over a million dollars. Accumulation of the fines has led to the largest code-enforcement fines in the history of Central Florida. Due to these high costs combined with a pricey cleanup, prospective buyers and the county have no interest in purchasing or foreclosing the property.

When it seemed like there was no hope left for the town, organizations such as United Global Outreach and UCF's Engineers Without Borders have joined the Bithlo community in installing a septic tank system and an aquaponic system to promote clean water, food growth, economic growth, and sustainability for the town. With little funding and limited infrastructure, these two groups have been working hard to achieve significant improvement.

I was lucky enough to conduct an interview with Joseph Klawe-Genao, one of the members of the Engineers Without Borders program working on the aquaponics system. Here is what he has to say about the project and the contamination in Bithlo:

A: Bithlo has, historically, remained a food desert - the citizens have had difficulty cultivating affordable and nutritious food at any point in time since the community was established. Since Bithlo became an unincorporated town in the mid-1900s, the citizens have also remained in a recurring, generational "loop" of subpar health practices and education. The Bithlo Project will not only feed the surrounding community, but it will serve as an example of a way to grow nutritious food year round. While growing food and educating the local community, namely the children of the nearby academy, the project will help break the "loop" of generational poor health and bring Bithlo back on its feet. In addition to the local benefits, we are looking to make Bithlo the example of a community successfully using an aquaponics system, so that other communities can rely on this project for similar projects they have in mind.

Q: What are the most notable issues concerning Bithlo's water supply?

A: A series of neglect to the surrounding land has caused the groundwater supply in Bithlo to become polluted. The petroleum discharge of a Circle K gas station in 1988 and the continuing release of toxic waste at the A-Z Recycling Plant have been identified as point-source pollution in the area. Several of the pollutants found in the water/ground by the gas station is not critical to the health of the population, although some citizens are not able to physiologically process the heavy metals, causing illness. An issue with the recycling plant has been that it is privately owned land. The government and concerned citizens are powerless to do anything about the problem unless the owner agrees to cooperate with officials. Millions of dollars in fines have been issued and the deed has been transferred many times because of that reason.

Q: Are you receiving a lot of support from the community?

A: There has been a great deal of support in the community. Residents often stop by the aquaponics system to take a look and are pleased to see things moving along. A few nearby Bithlo residents have taken part in the build, such as providing information on construction and building code, for example. The only known caveat to this transition has been misplaced distrust in groups attempting to change the way the residents have lived for nearly a century after the community encountered financial troubles. The polluted water and the un-incorporation process left many citizens feeling abandoned. The situation is changing rapidly for the better; bus lines are being planned for Bithlo, the groundwater pollution has been addressed and is being taken care of, the population is expanding and other services, such as medical services and schools, have or are being built to accommodate Bithlo's citizens.

Q: What exactly is an aquaponics system?

A: An aquaponics system integrates fish cultivation and the growing of plants. The idea is to create a loop, beginning with a few dozen fish (there are many to choose from) who will consume food and create waste. The fish waste will be transferred to grow beds primarily comprised of vegetables that are suited for the climate. Water carrying the nutrients from the fish waste will pass through the plant beds, which float on "rafts" to eliminate dependency on the soil. The water will then make its way back to the fish tanks, cleaned and filtered naturally by the plants. Both the fish and plants can be harvested and consumed. A benefit of an aquaponics system is that it can be created on multiple scales, commercial and individual. Aquaponics systems also allow the consumers to become independent of an outside food source, even in a food desert.

Q: What are some major successes and challenges you have faced during this project?

A: A major success would be the support we have gained from the project over time. Several organizations have supported this project - from Wholesale Foods to the Rotary Club, to UCF - and the support from these organizations have allowed us to make some incredible progress over the past year. A challenge that we had to face would have been the initial build phase for some of the components, such as the steps leading up to the system, where we had to churn out numbers on-site as well as make multiple cuts of materials on hand. We had to overcome unexpected obstacles. Everything turned out well, including the steps, although the process involved the whole team and required much more attention than we initially drafted.

Police Say To Carry This

Police say everyone should carry this new safety device that protects attackers.

9 Investigates: Cancer-causing chemical found at Bithlo site for planned development

Updated: Jan 28, 2016 - 8:21 PM

ORANGE COUNTY, Fla. - 9 Investigates found out Orange County leaders detected a chemical considered highly likely to cause cancer in humans on a property set for a new Habitat for Humanity development.

Emails between officials from last summer show trichloroethylene, or TCE, was detected on the Bithlo property where dilapidated trailers were torn down.

The chemical can cause multiple types of cancer and neurological problems. It was found on three properties on Lansing Street.

Police Say To Carry This

TrySafePersonalAlarm.com

Police say everyone should carry this new safety device that protects against attackers.

OPEN

“We had two properties that my division found contamination of TCE on, and then there was some old data the health department found TCE some years ago,” said Lori Cunniff, deputy director of Community and Environmental Services.

Channel 9’s Janai Norman made a public records request for dozens of documents from county leaders regarding TCE and the property where habitat plans to build 10 homes.

In one, Cunniff wrote, “If you put in housing, either a very deep well or public water is needed, as there are contamination plumes in the area, and you don’t want to suck up the contamination in the well.”

Some residents near the property said TCE has been a problem for them before.

“I have definite problems from it. I’ve got nerve damage,” said Jim Coffey

He said his nerve damage was caused by contaminated water.

After the county found TCE on Coffey’s property, he had to dig a deeper well to get safe, clean water.

“I have the highest level of TCE out here,” he said.

Cunniff said there are lower levels of TCE where habitat for Humanity plans to build, so the water was safe to ~~down~~, but added that the fact TCE was detected was reason enough for concern.

“You always worry when you detect any kind of contamination. You ~~keep~~ an eye out for the surrounding area,” said Cunniff.

Though the TCE was first detected years ago, she said county leaders are doing an extensive environmental study to make sure it’s safe before ~~any~~ new homes are built.

The study should be completed in May and will show what needs to be done before the property is redeveloped.

Cunniff said it’s not known where the TCE came from.

PETITION TO BOARD OF ZONING ADJUSTMENT

We the undersigned neighbors of East Orlando Estates hereby vehemently oppose the Special Exception in the A-2 zoning district to allow for a yard trash processing facility applied for by BISHOP AND BUTTREY, INC. Case # SE-19-05-039.

We urge the BOARD OF ZONING ADJUSTMENT to reject the proposed exception. We feel that this type of business will be detrimental to our neighborhood. We are concerned that this proposed exception could result in the following:

1. Reduced property values
2. Increased hazardous pest population, spreading disease
3. Decreased air quality

PETITION TO BOARD OF ZONING ADJUSTMENT

We the undersigned neighbors of East Orlando Estates hereby vehemently oppose the Special Exception in the A-2 zoning district to allow for a yard trash processing facility applied for by BISHOP AND BUTTREY, INC. Case # SE-19-05-039.

We urge the BOARD OF ZONING ADJUSTMENT to reject the proposed exception. We feel that this type of business will be detrimental to our neighborhood. We are concerned that this proposed exception could result in the following:

1. Reduced property values
2. Increased hazardous pest population, spreading disease
3. Decreased air quality

PETITION TO BOARD OF ZONING ADJUSTMENT

We the undersigned neighbors of East Orlando Estates hereby vehemently oppose the Special Exception in the A-2 zoning district to allow for a yard trash processing facility applied for by BISHOP AND BUTTREY, INC. Case # SE-19-05-039.

We urge the BOARD OF ZONING ADJUSTMENT to reject the proposed exception. We feel that this type of business will be detrimental to our neighborhood. We are concerned that this proposed exception could result in the following:

1. Reduced property values
2. Increased hazardous pest population, spreading disease
3. Decreased air quality

ROLLING TODAY

Spring 1997

No Holds Gard
New National Sales Director Larry Gard sets out to pump up results and get more support for Orkin inspectors.

President's Club
Outstanding achievers honored with a dream trip.

**Orkin Goes On The
Offensive Against Termites**
New baiting technology reduces environmental impact and increases effectiveness.

Paul Hardy, Orkin senior technical services manager, uses a soil sample tube - popularly known as a "pogo stick" - to create a hole for a termite bait system.

Palm Rats / Roof Rats

Rattus rattus

Size: 5' -7" long

Color: from black to dark gray to dark brownish grey, with lighter bellies

Legs: Four

Roof Rat Facts

Roof rats, also known as palm rats, palm tree rats, black rats, ship rats or house rats, are the leading rodent pest in Florida (<https://www.catseyepest.com/locations/fl/maples>) and in other tropical climates.

As is the case with many rats, the roof rat can transmit a variety of different diseases that are harmful to both humans and other animals. Some of these diseases include murine typhus, leptospirosis, salmonellosis, rat-bite fever and even the plague. A few of these diseases are rarer than others, however, if you find yourself in contact with rats and develop flu-like symptoms or skin discolorations within a few days after exposure, immediately seek medical attention.

Roof Rat Identification

The roof rat's body spans from three to eight inches and they have the ability to jump as far as eight feet. Their lifespan is two to three years. Female rat litters can range from five to eight babies and they can give birth up to six times a year.

What do they look like?

- Reddish brown in color and have a yellowish margin on their body
- 1.5 to 2 inches in length
- Largest cockroach in the U.S.

Where do they live?

- American cockroaches **usually lives in dark, damp areas** such as sewers, storm drains, steam tunnels, and outdoors in landscaping and tree holes
- Prefer warm, dark, humid environments in homes such as wall voids, crawl spaces, basements, utility rooms, or attics
- **Typically feed on decaying organic matter** and a variety of other foods

What are the risks?

- **Not commonly seen in homes**
- May move indoors during colder months seeking warmer temperatures and food through openings in the foundation

How do you get rid of them?

- Granular baits in attics and crawl spaces

American Cockroaches (Palmetto Bugs)

American roaches, also known as palmetto bugs or waterbugs, are large, sometimes fly, and usually only come indoors in search of warmth, food or water.

8/18/2019

What Do Cockroaches Eat and Where Do They Live When There are No Houses Around?

Unlike their German counterparts, the American cockroach will **live outdoors** (in warmer climates), and in places like Florida, they can be found around garbage, **in trees and in woodpiles**. During periods of heavy rains, this species **is known to "mass migrate,"** and overrun a building. The bugs are managed around homes by caulking cracks, removing rotting vegetation and keeping areas around the structure as dry as possible.

Indigenous to Africa, the American cockroach was introduced across the pond in the 17th century and is usually found below ground in drains, steam tunnels, sewers and basements. Prolific, one community of *Americana* that was discovered in a single sewer manhole consisted of 5,000 members.

On average, each female of the species will produce 150 eggs over a 10-month period and will deposit them, in clusters inside a hard-shelled case, near a food source – sometimes "gluing" the case to the source with her spit.

After hatching, the American cockroach goes through several stages of development, but during each it actively forages for food. Opportunistic, they enjoy whatever is at hand and **will eat decaying matter,** as well as bread and fruit, paper and clothes, hair and even shoes.

Because of their proclivity for sewers and human waste, the American cockroach **spreads over 22 species of organisms that cause disease in humans,** including protozoans, viruses, fungi and bacteria, as well as several **species of parasitic worms.**
